Google LLC
University Programs / Software Engineering Internship Recruiting

Dear Hiring Manager,

I am writing to apply for a Software Engineering Internship at Google. I am a Computer Science undergraduate at NIT Jalandhar (CGPA 7.86/10), and over the past several months I have had the opportunity to take a project from a blank page to a production system used by real end users — an experience that has sharpened both my technical depth and my ability to own a problem end to end. I would welcome the chance to bring that same ownership to a team at Google.

Since December 2025, I have been the sole developer on a confidential ballistic computation system contracted by the Indian Army. I designed and built the full stack — a JavaScript and Python computation engine that processes multiple ballistic parameters in under five seconds, paired with a real-time dashboard that lets non-technical personnel operate the system without assistance. Running the complete software development lifecycle alone, from requirements through testing, taught me how to make sound architectural decisions under real constraints and to deliver reliable software when there is no one else to catch a mistake.

Alongside this, I have built and deployed several independent projects: a Python REST API with geofencing triggers that automated daily mess tracking with sub-500ms response times, a data-driven crop-market optimizer using Pandas and NumPy, and a full-stack research document dashboard deployed on Microsoft Azure that cut document retrieval time by 70%. I have also solved 400+ LeetCode problems spanning arrays, trees, dynamic programming, and graphs, and competed in Codeforces-rated contests, which keeps my data structures and algorithms fundamentals sharp for the kind of problem-solving Google's engineering culture is known for.

I am drawn to Google because of the scale and rigor at which its engineers build systems that genuinely affect people's lives, and the culture of mentorship that comes with that. I would be glad to bring my hands-on production experience, strong fundamentals, and habit of owning problems completely to a team this summer, and I am confident I would grow quickly by learning from Google's engineers.

Thank you for considering my application. I have attached my resume for further detail and would welcome the opportunity to discuss how I can contribute to your team.

Sincerely,
Sandeep Yadav
